

Health Care System

Problem Statement

To create a user-friendly java application for a Health Care System.

Description

The system consists of various diagnostic centers, with their own tests which the customers can opt for. The system should be accessible to two types of users, namely admin and customer. Admin has control over adding, removing and updating diagnostic centers and the tests under them.

Customer makes an appointment after selecting a proper date-time as well as the test and diagnostic center. The appointment will be confirmed only after the admin approves it.

Scope

User can select only one test at a time. Thus, an appointment can be only for 1 test at a time inside a center. Users have to make an appointment for a test under any diagnostic center and that appointment has to be approved by an admin.

Out of Scope

An appointment will be in the database till it is manually deleted by the database admins.

User methods:

+Add Center (Admin)

Admin can add new centers. Center name has to be specified and the centerId will be generated automatically.

+Remove Center (Admin)

A center can be removed from the system by the admin. The center object will be removed from the centerList and then destroyed.

+Add Test(Admin)

Admin first selects a diagnostic center and then adds a new test in it.

+Remove Test(Admin)

Admin first selects a diagnostic center and then gets a list of all tests available inside the selected diagnostic center. Any test can be removed from the list and saved.

+Approve Appointment(

Admin first get list of all centers, then gets the appointmentList from that center. Admin can then approve or reject the appointments.

+makeAppointment(user: User, center: DiagnosticCenter, test: Test ,datetime: Datetime):BigInteger

User selects a test in a diagnostic center and books a datetime for the same. This appointment is added in the AppointmentList of the Diagnostic center the test is booked in.

register(): String

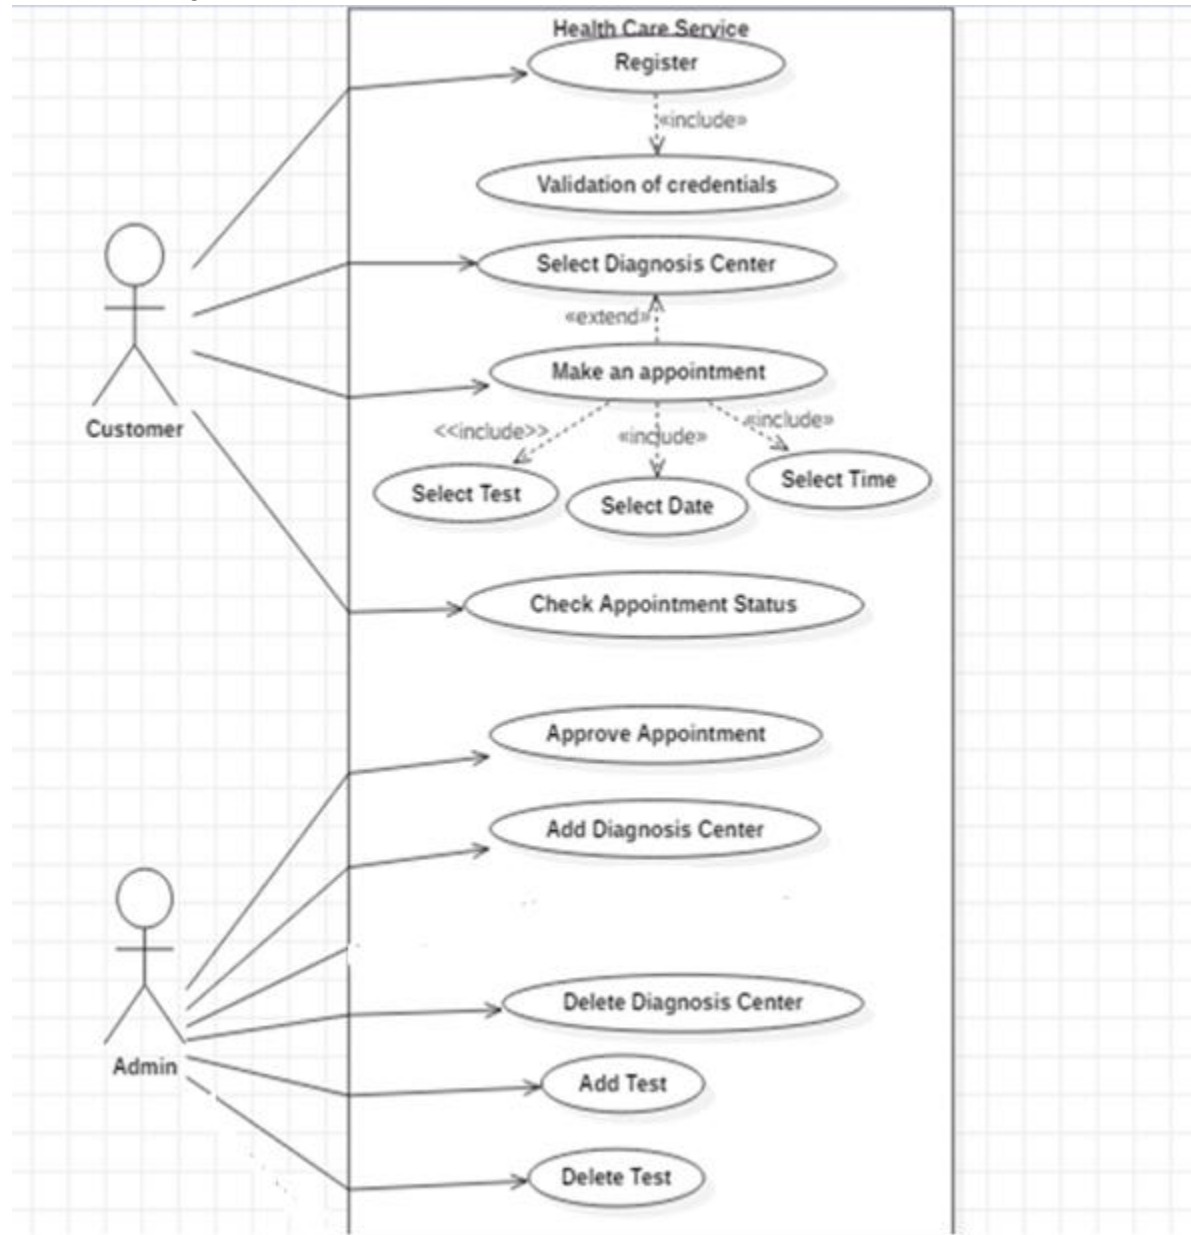

User id is generated automatically. By default user role is set to customer.

Assumptions and validation:

1. Register - (customer):
 - a. Userid: Automatically generated.
 - b. Password: Password must contain one number,one alphabet,one special character and size should be at least 8 characters and not more than 14 characters.
 - c. Phone: Phone number should be 10 digits.
 - d. Name: Name should not start with special characters and should not be blank. First letter should be capital.
 - e. For registration, default role is user.
2. Make an Appointment -
 - a. User gets a list of diagnostic centers, and he selects one of them.
 - b. After selecting a center, user can select the test he wants from the list of available tests in that center.
 - c. After submission of the form, the new appointment will be added in the "Appointment List", so that the admin can approve it.
 - d. One appointment can be for only one particular test.A new Test can be created by an admin which can contain multiple test, like a superset of two or more tests, however that super test will be independent of the others and will be treated as one.
3. Add Center:
 - a. Center ID will be generated automatically.
 - b. A newly added Diagnostic Center will have 3 default tests present in it, namely blood group, blood sugar and blood pressure. Admin can remove or update them later if needed.
4. Add Test:
 - a. TestID will be generated automatically.
5. Remove Center:
 - a. All the test objects under the center will be destroyed.
6. Approve Appointment:

- a. Admin retrieves a list of all centers and selects one. A list of all appointments corresponding to the center he selects is shown to him, which he can approve/disapprove.

Use case Diagram:

Classes: For this project, we are creating 4 Classes.

1. User
2. Diagnostic Center

3. Test
4. Appointment

Class Description and roles

A. DTO Layer

1. **Diagnostic Center:** *For each diagnostic center the admin will create.*

Each center has a unique centerId and a list of available tests under it. Any new appointment made for the tests under a particular diagnostic center will be added in the "appointmentList". This appointment list will be viewed by the admin and reviewed.

Attributes:

- centerName: String
- centerId: String
- listOfTests: List<Test>
- appointmentList: List<Appointment>

2. **Test:** *For each test present under a diagnostic center.*

Each test will have a unique id across all diagnostic centers. Tests will be saved in the listOfTests under the corresponding DiagnosticCenter.

Attributes:

- testId String
- testName String

3. **Appointment:** Saves the details of the appointment the customer makes. Each appointment will have information of the user, the Test it is for, the DiagnosticCenter it is placed in and the date-time. Each appointment has to be approved by the admin.

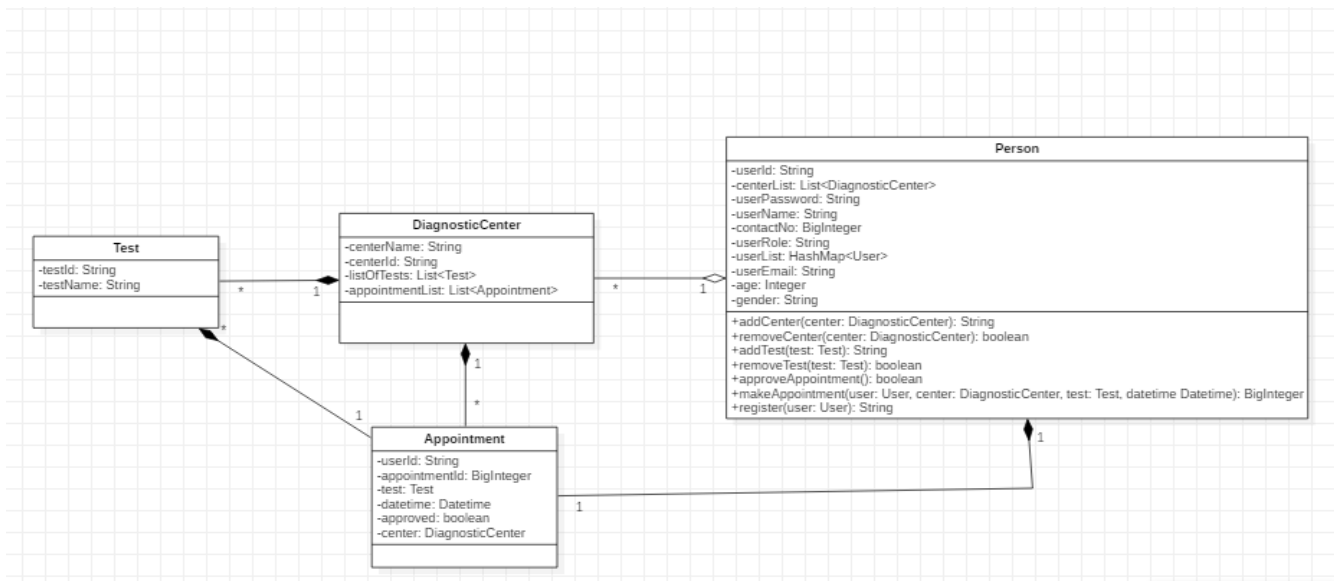

- user User;
- appointmentId: BigInteger
- test: Test
- datetime: DateTime
- approved: boolean

4. **User:** Depending on the type of user, a user role specific menu will be shown.

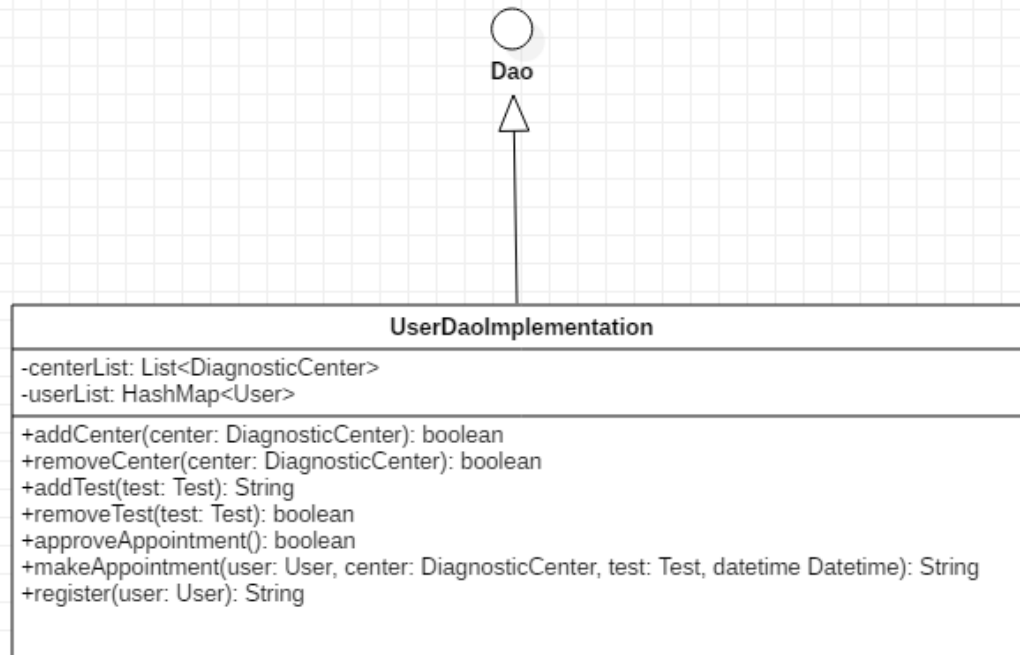

- userId: String
- centerList: List<DiagnosticCenter>

-userPassword: String
-userName: String
-contactNo: BigInteger
-userRole: String
-emailId: String

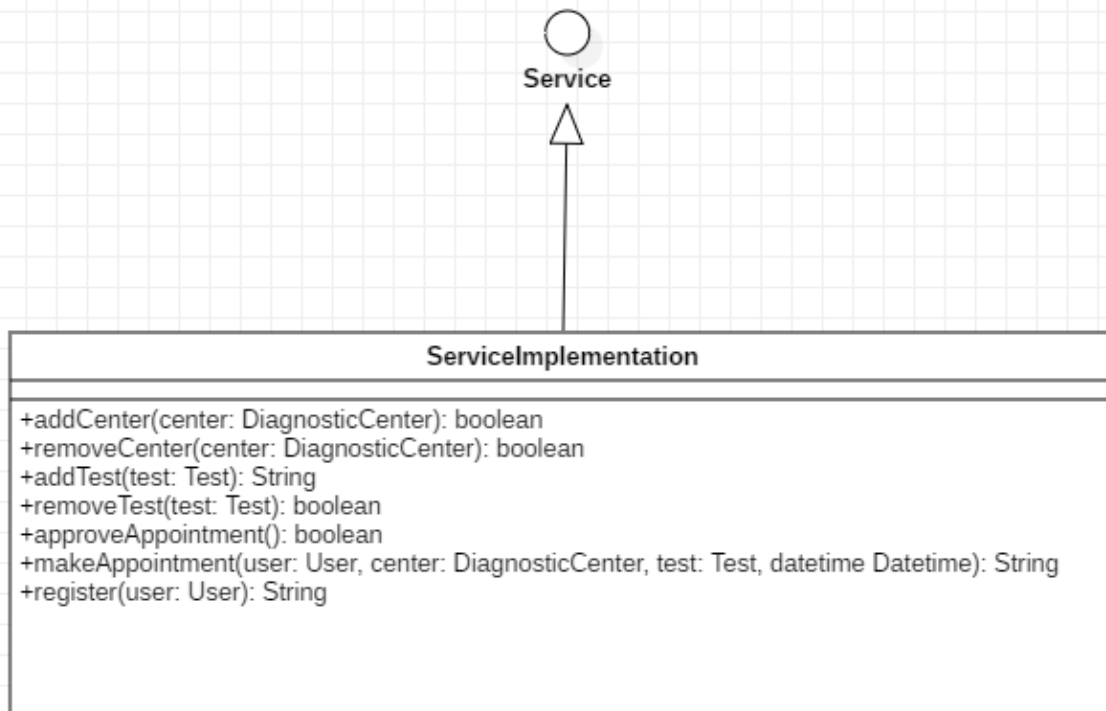

Class diagram for DTO layer:

B. DAO layer

C. Service Layer:

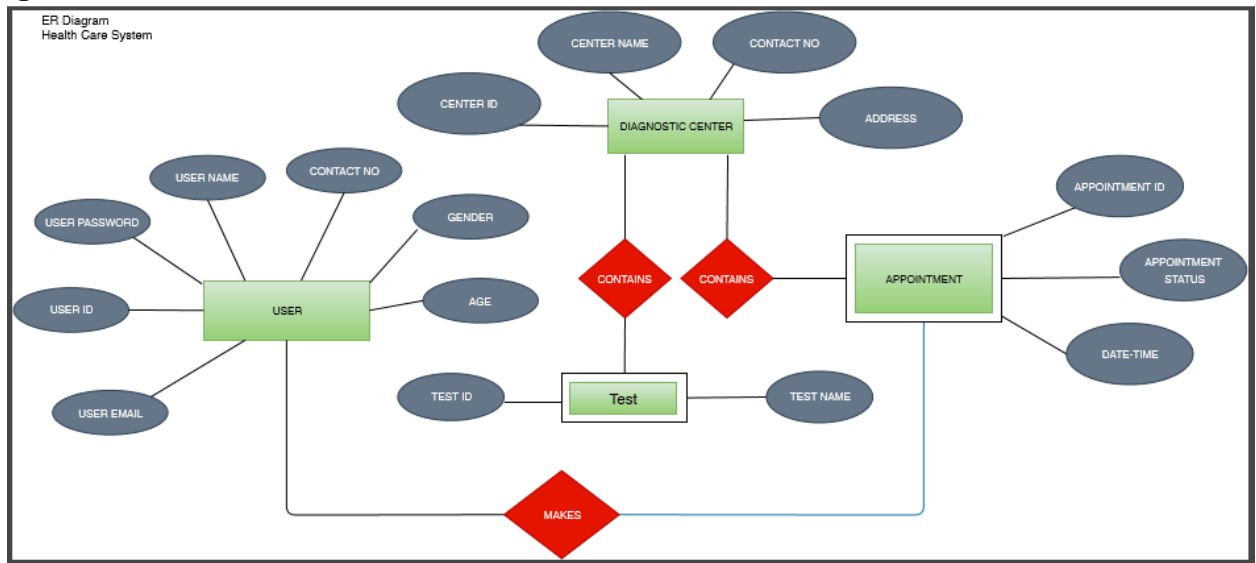

Relationships:

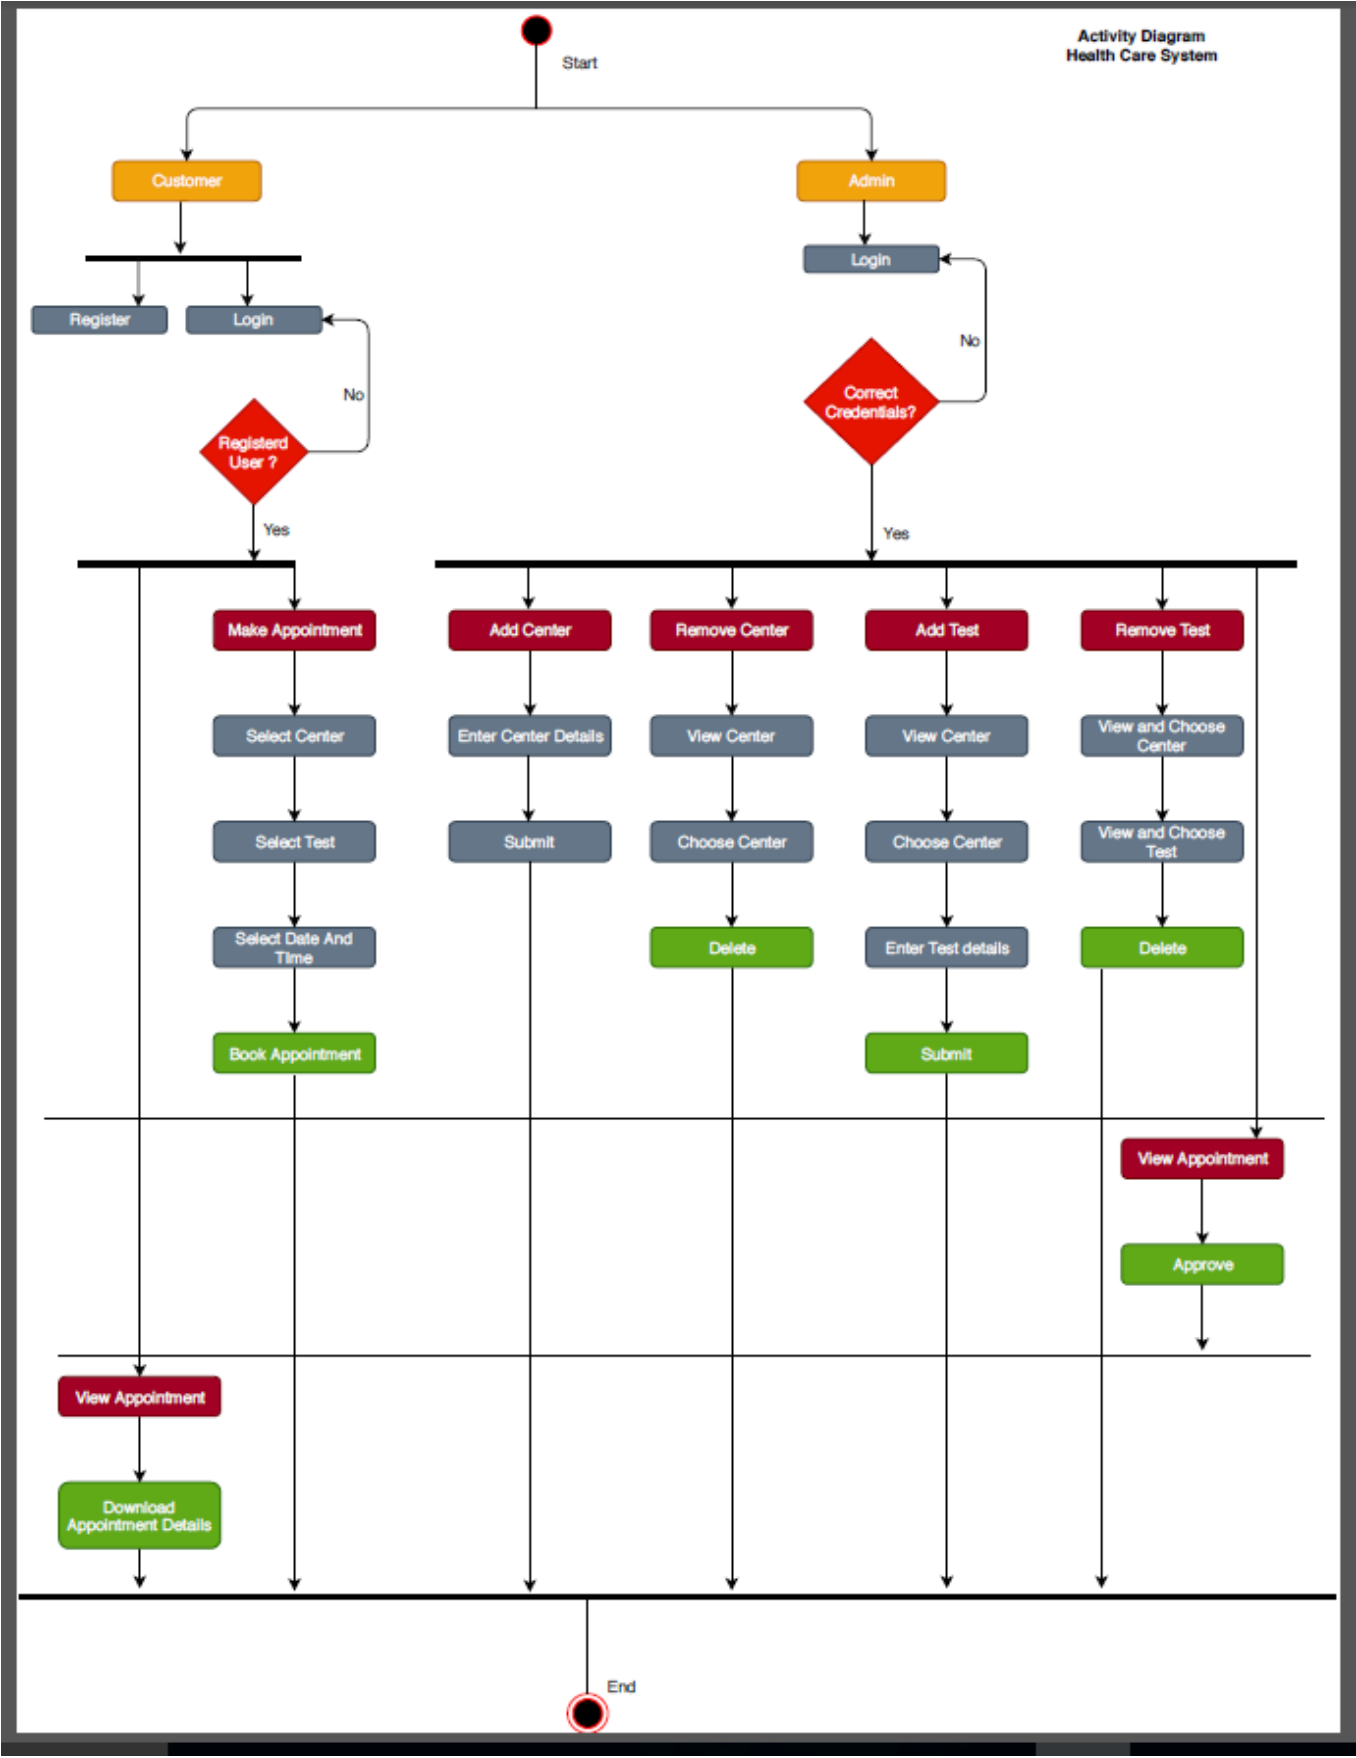

1. HealthCareSystem and DiagnosticCenter have **1 to many** relationship.
2. DiagnosticCenter and Test have **1 to many** relationship.
3. Appointment and DiagnosticCenter have **many to one** relationship.
4. Appointment and User have **one to one** relationship.
